SPURS^2 HACKATHON | RIGHTS AND COMPLIANCE | THEME: DRIVING PARTNER ADOPTION

PULSE: more content partners can actually use

In the next 8 minutes: why most club content never reaches partners, how PULSE clears it in seconds on ScorePlay and TwelveLabs, and where it goes next.

01

The problem

Partners pay for content they can't use. Every asset carries rules nobody has time to check.

1:00 MIN

02

What PULSE is

A compliance layer inside ScorePlay, with TwelveLabs finding the evidence.

0:45 MIN

03

Live demo

A USAA brief for the San Antonio Spurs: one clip blocked, a compliant alternative found.

3:30 MIN

04

What's new

Compliant duplicates, first-view checks and sponsor-versus-image rules.

1:00 MIN

05

What's real today

51 of 51 adversarial checks pass. ScorePlay read and search are live.

0:45 MIN

06

Roadmap and ask

From one partner pilot to every club on ScorePlay.

0:45 MIN

AI finds the evidence. Rules make the decision. People resolve the gray areas.

PULSE: Agentic Rights and Brand Compliance

Presentation script | Theme: **Driving Partner Adoption** | Spurs^{2} Hackathon, Rights and Compliance | 8 min from 3:00 PM CT

AI finds the evidence.
Rules make the decision.
People resolve the gray areas.

Run of show: 8 minutes from 3:00 PM CT

Time	Section and talking points	Scores
3:00:00 1:00	**1. Preview (slide 1), then the problem: partners can't use what clubs capture** • Partners pay for content they can activate. Every game produces thousands of photos and clips, each with rules on territory, platform, sponsor, music, people and expiry. • Teams check by hand, after the moment has passed. Most assets never reach partners, and one wrong post means a lawsuit, a fine or a sponsor dispute (pick one example at right). • A single pass/fail badge is wrong: one clip can be fine on Instagram in the US and blocked on a sponsor post in the UK.	Practicality 25
3:01:00 0:45	**2. What PULSE is** • A compliance layer inside ScorePlay. **AI finds the evidence, rules make the decision, people resolve the gray areas.** • TwelveLabs finds the moment; its start/end seconds map to ScorePlay logs. Find > Analyze > Evaluate > Find alternative > Write back.	Fit with ScorePlay and TwelveLabs 25
3:01:45 3:30	**3. Live demo: "Promote USAA in the US with the San Antonio Spurs"** • Partner brief in: PULSE returns one cleared, one review and one blocked asset. • Rights Passport: 7 uses x 3 regions, with consent, license scope, AI evidence and reasons. • **The moment:** first clip BLOCKED. PULSE says why and offers a compliant duplicate: clean audio, another angle, or a similar safe moment. • First-view gate (cover, first 3 seconds, crops), then the ScorePlay handoff.	Technical execution 20 Presentation 15
3:05:15 1:00	**4. What's new** • **Compliant duplicates:** same version, same media, same moment (other angles via shared clock), same meaning (TwelveLabs search). • **First-view compliance** and **sponsor x image** rules: a family brand never next to alcohol.	Originality 15
3:06:15 0:45	**5. What's real today** • 51 of 51 adversarial checks pass. ScorePlay read and search are live; write-back is gated until taxonomy and permissions are approved. • Rules are public baselines, not legal advice. Production uses each club's counsel-approved rule pack.	Technical execution 20
3:07:00 0:45	**6. Roadmap and close: driving partner adoption (slide 3)** • **Now:** the loop you just saw. **Next 90 days:** pilot one partner campaign, switch on write-back, load the club's own rule pack. **Then:** music, player-status, deepfake and betting checks, rights receipts, ScorePlay Connect. • More cleared assets per partner, in seconds instead of days. Ask: one club, one partner, one pilot.	Presentation 15 Practicality 25
3:07:45 0:15	**Buffer** • If the demo stalls, switch to the backup recording at once.	

Problem talking points: real incidents

Industry example	What PULSE checks
Music. July 2024: publishers sued 14 NBA teams over songs in social videos, seeking up to $150K per infringement. Settled May 2025.	Unlicensed music; a license record per song
Player status. 76ers fined $100K (Dec 2025) for misreporting a player's status. Oct 2025 indictments allege betting on non-public player info (allegations, not proven).	Hold pregame, practice and medical-room content until the official report
Tampering. 76ers and Daryl Morey fined $75K each (2021) over a post about another team's player.	Captions, on-screen text, other teams' players
Global reach. 2019: one tweet led Chinese state TV to suspend NBA broadcasts.	Region-specific rules
Deepfakes. 2025: LeBron James' lawyers sent a cease-and-desist over AI deepfake videos.	Block AI-altered player images; AI reasons cite only detected evidence
Wrong takedown. A broadcaster's mistaken claim pulled an NBA game from the league's own YouTube channel.	A rights receipt for every cleared asset

Present these as industry-wide, not about any one club on the panel.

Decision model

CLEARED	REVIEW	BLOCKED
Every required rule proven; use is in scope	Evidence or rights incomplete; a person decides	A rule failed; PULSE explains and finds an alternative

Likely judge questions

• **Where do the rules come from?** Public baselines for the demo; each club's lawyers own its rule pack, no code changes.
• **What if the AI is wrong?** AI only supplies evidence. Rules decide, and anything uncertain goes to REVIEW, never CLEARED.
• **Why not just ScorePlay tags?** Tags describe a whole asset. PULSE decides per use, per region, per moment, and writes that back.
• **Why is write-back off?** It waits for the club's taxonomy and permission sign-off. That's the safe default.
• **How does this drive partner adoption?** Partners get more usable content, faster, with no brand conflicts. Track cleared assets per partner and turnaround time.

ROADMAP

From one pilot to every club on ScorePlay

Each step turns a real industry incident into a check that runs before anything reaches a partner.

Now

Built for today's demo

- ScorePlay read and search; TwelveLabs finds moments and evidence
- Deterministic rules: CLEARED, REVIEW, BLOCKED
- Rights Passport: 7 uses x 3 regions with reasons
- First-view gate: cover, first 3 seconds, crops
- Compliant duplicates on 4 levels
- 51 of 51 adversarial checks passing

Next

Pilot: first 90 days

- One club, one partner campaign, measured end to end
- Switch on ScorePlay write-back after taxonomy and permission sign-off
- Replace public baselines with the club's counsel-approved rule pack
- Must-haves: AI reasons cite only detected evidence; overtime and time zones shift embargoes
- Music check and a license record for every song
- Audit log of every override: who, when, why

Then

Scale: 3-12 months

- Hold pregame, practice and medical content until the official injury report
- Flag other teams' players and check captions and on-screen text
- Region-specific sensitive-topic and betting-partner rules; never near minors
- Block AI-altered player images; rights receipts to dispute wrong takedowns
- Track roster trades, sponsor deals ending and edited copies of blocked assets
- Sponsor seconds-on-screen reports; listing on ScorePlay Connect

How we'll measure partner adoption	Cleared assets per partner	Brief-to-delivery time	Conflicts caught before posting	False clearances: zero

The ask: one club, one partner, one pilot. Let's clear more content for partners this season.

Rules are screening baselines for the demo, not legal advice.
